

Merino ewe profile for spring lambing

High Rainfall Zone

How to use this chart

This chart is marked with the recommended merino ewe condition scores for spring lambing in the high rainfall zone of southern Australia.

Using a non-permanent pen, mark the average condition score of the mob being monitored on the chart. Assess the mob close to the * as possible, adding further assessments if needed.

If the mob average is condition score 2.2 or below, at least 1/3rd of the individuals of that mob will be below the recommended condition score for a breeding ewe.

This chart is designed to be used in conjunction with the lifetime^{wool} 'Ewe Management Handbook'. Feed budgeting tools to aid in the meeting of this chart are available from www.lifetimewool.com.au
